

Gypsum Recycling Company of the Month

EGRS Ltd: Expert knowledge, excellent equipment, engineered solutions

Business and Industry Today is extremely proud to present EGRS with the highly prestigious Company of the Month award. This is due to the rapid growth and development the ground breaking company has experienced since its inception. Having now established itself as a leading competitor, EGRS has cemented its ever-increasing reputation as the market leader, ensuring further success and expansion.

As a subsidiary of the Enviro Grind group based in Ireland since 1997, EGRS delivers a new and innovative technology to the market for the processing of gypsum based waste streams. By bringing together numerous decades of engineering and processing knowledge and specialities in the concept and design of the EGRS Gypsum Recycling System, this pioneering company supplies bespoke gypsum recycling systems to the industry.

After many years of research, trials and development, Managing Director Martin Eves commissioned the first Gypsum Recycling System in 2004, a system that Enviro Grind still operate to this day. Martin went on to establish EGRS Ltd in April 2005, to provide simple low cost turn-key solutions for the recycling

of gypsum waste while improving existing processing technologies.

This highly ground breaking system can provide a minimum 95% recovery of a gypsum waste stream while resolving the issues of high moisture content and contamination to achieve a very high quality product, sized to the customer's requirements. This product can then be re-used, thus reducing pressure on raw material resources and the environmental impact of mining operations.

Most countries have now imposed either restrictions or bans on the land-filling of gypsum waste streams and many are mandating through regulations that this material be separated and recycled. The EGRS Gypsum Recycling System allows operators to meet with current environmental legislation and eliminates the need for gypsum waste to go to landfill, while converting a waste disposal cost to a significant income generator for their business.

The EGRS Gypsum Recycling System is an innovative combination of state of the art processing technologies, incorporating decades of knowledge in milling, mining and screening by

world renowned specialist manufacturers and has produced a solution designed to deal with the difficulties of waste gypsum processing. The EGRS Gypsum Recycling System can be used by any industry that has waste gypsum products and is suitable for the domestic and worldwide market. Its modular concept allows for systems to be designed and scaled to the individual customer's exact requirements and is available in Semi-mobile and Static formats.

Providing a bespoke service to its clients, EGRS is able to design a system specific to the client's needs, ensuring that the core concept of the system remains the same. What also sets this
